

Executive Functioning Assessment

Executive function skills rely on three primary brain functions: working memory, mental flexibility, and self-control. We use these skills on a daily basis to learn, work and manage our day- to-day tasks. Difficulties with executive function can impact a child's ability to focus, follow directions and regulate their emotions.

Our executive functioning evaluation assesses various components of executive functioning through a combination of assessment tools, parent and child interviews, observations, and quantitative and qualitative measures.

The executive functioning evaluation is suitable for a child who does not have a history of developmental or academic concerns. Children with concerns in these areas benefit from a comprehensive diagnostic and psychoeducational evaluation. After the parent intake session, the psychologist determines which evaluation would be most beneficial for the child.
